BRIEF ON APPEAL

Mail Stop Appeal Brief – Patents
Commissioner for Patents
Box 1450
Alexandria, VA 22313-1450

Sir:

The following Appeal Brief is submitted pursuant to the Notice of Appeal filed on August 17, 2004, for the above-identified application.

10/20/2004 EAREGAY1 00000037 500476 10064128

01 FC:1402 340.00 DA

I. Real Party in Interest

The real party in interest in this matter is the General Electric Company.

II. Related Appeals and Interferences

There are no other known appeals or interferences which will directly affect or be directly affected by or have bearing on the Board's decision in the pending appeal.

III. Status of the Claims

Claims 1-20 stand rejected in the Final Office Action. A copy of the claims on appeal is attached as an Appendix.

IV. Status of Amendments Filed After Final

There have been no amendments filed subsequent to the final rejection.

V. Summary of the Invention

A high level system view of the system is illustrated in Figure 1. The details of Figure 1 are described in paragraphs 14-16.

Claim 1 is directed to a diagnostic system 10 for a data acquisition system that includes a computer controller 14 coupled to the data acquisition system. A display device 22 is coupled to the computer controller 14. The controller receives data from the data acquisition system, and diagnoses a problem in response to the data. The controller generates a screen display corresponding to an architectural representation of the data acquisition system. A screen display 70 is illustrated in Figure 4 and is described in paragraphs 19, 20 and 21. The controller 14 generates screen indicia 82A-82D on the display device corresponding to a location of a problem on the schematic representation of the data acquisition system. As mentioned in paragraph 20, boxes 82A, 82B, 82C, and 82D correspond to errors found in the critical to quality characteristics. Thus, these components can easily be replaced by merely looking at the schematic representation on the screen indicia. That is, there is a one-to-one basis with the circuit board and the data acquisition that corresponds to the screen indicia. Thus, the claims recite a "architectural representation" of the data acquisition system.

Claim 2 specifically recites that the data is stored in a memory 18.

Claim 3 recites that the computer controller and data acquisition system are coupled together by a network represented by interconnection 36.

Claim 4 recites that the network comprises a public service telephone network.

Claim 5 recites that the network comprises the internet.

Claim 6 recites that the controller has a web browser and that the controller generates screen indicia through the web browser.

Claim 7 is an independent claim and recites a diagnostic system 10, a data acquisition system 30 coupled to the diagnostic system, a computer controller 14 coupled to the data acquisition system 30, a display device 22 coupled to the computer controller 14. The controller 14 receives the data from the data acquisition system. The controller diagnoses a problem in response to the data. The controller generates a screen display 70 corresponding to an architectural representation of the data acquisition system. The controller 14 generates screen indicia 82A-82D on the display device 22 corresponding to a location of the problem on the schematic representation of the data acquisition system. The limitations of claims 7 and 1 are similar and thus will be described together below.

Claim 8 recites a computed tomography system comprising a system as recited in claim 7. A CT system is illustrated as box 12 in Figure 1.

Claim 9 is similar to claim 8 but further refines that the data acquisition system is disposed in the computed tomography system 12.

Claim 10 is dependent upon claim 9 and recites that the computed tomography system comprises a detector assembly. The data acquisition system is disposed within the detector assembly.

Claim 11 recites that the data is stored in a memory.

Claim 12 recites that the data is communicated in the data acquisition system.

Claim 13 recites that the data acquisition system is located remotely from the diagnostic system 12.

Claim 14 further recites a network 36 coupling the computer controller and the data acquisition system 30.

Claim 15 recites that the controller 14 has a web browser. The controller generates the screen indicia 82A-82D through the web browser.

Claim 16 is an independent claim and recites a method for operating a diagnostic system that includes receiving data from a data acquisition system 30. The claim further recites diagnosing a problem in response to the data and generating a screen display 70 corresponding to a schematic representation of the data acquisition system 30. The method also includes generating a screen indicator on the display device corresponding to a location of a problem on the schematic representation of the data acquisition system.

Claim 17 recites that the data comprises receiving data through an interface 36.

Claim 18 recites that receiving data comprises remotely receiving data.

Claim 19 is dependent upon claim 1 and recites that the data is communicated from the data acquisition system.

Claim 20 recites that the data acquisition system is disposed within a CT system 12.

As mentioned in paragraph 21 of the present application, the present invention allows a technician or assembly person to easily locate and identify the problem in a data acquisition circuit or other complicated circuit without the need to interpret a vast amount of data. In prior systems, finding the location of a certain fault once a fault was identified was difficult and time consuming and led to errors. The present invention allows an architectural representation to be formed of this schematic of the system so that the location of the fault may be easily identified and a remedy applied rapidly thereto.

VI. Grounds of Rejection to be Reviewed on Appeal

The following issues are presented in this appeal:

Whether claim 8 is improper for failing to further limit the subject matter of the previous claim.

Whether claims 1-8, 16 and 17 are anticipated under 35 U.S.C. §102(e) by *Schleiss* (6,298,454).

Whether claims 9-14 and 18-20 are obvious under 35 U.S.C. §103(a) as being unpatentable over *Schleiss* in view of *Taguchi et al* (5,807,256).

VII. Argument

The Rejection of Claim 8

Claim 8

The Examiner objects to claim 8 for being improper independent form under 37 C.F.R. 1.75(c). The Examiner states that claim 8 recites the same limitations as claim 7 and therefore does not further limit claim 7. Appellants respectfully disagree. Claim 8 is directed to a computed tomography system, whereas claim 7 is specifically directed to a general "system." A preamble may be limiting and thus claim 8 limits the "system" to a computed tomography system. Therefore, Appellants respectfully request the Board to reverse the Examiner's objection to this claim.

The Rejection of Claims 1-8, 16 and 17

Claim 1

The *Schleiss* reference is a diagnostic tool that automatically collects data and stores data indicative of a variability parameter, a mode parameter, and a status parameter and a limit parameter associated with each of different devices, loops or function blocks within a process control system.

Appellants admit that the *Schleiss* reference shows diagnostics in a process control system. However, the Examiner points to Col. 3, lines 40-51 and 50-64, for the premise that an architectural representation of the data acquisition system is known and that the screen indicia on the display corresponding to a location of a problem on the schematic representation of the data acquisition is set forth therein. Applicants have reviewed these sections and can find no teaching or suggestion for the architectural representation of the data acquisition system and screen indicia display corresponding to a location of the problem on a schematic representation of the data acquisition system. Such a display, for example, is set forth in the present invention and Figure 4 which shows screen indicators 82a-d correspond to locations of a problem on the schematic representation of the data acquisition system. No such teaching or suggestion is provided in the *Schleiss* reference. Therefore, Appellants respectfully request the Board to reverse the Examiner's position with respect to claim 1.

Claims 2-5

Claims 2-5 are dependent upon claim 1 and are believed to be allowable for the same reasons set forth above.

Claim 6

Claim 6 recites that the controller has a web browser and that generating the screen indicia is performed through the web browser. No teaching or suggestion is formed in the *Schleiss* reference for a web browser. Appellants therefore respectfully request the Board to reverse the Examiner's position with respect to claim 6 independent to the determination of claims 1-5.

Claim 7

Claim 7 is a specific embodiment of claim 1 and recites in more detail a diagnostic system and a data acquisition system. The remaining portions of claim 7, that is, the computer controller, the display device and the operation of the controller are identical to that of

claim 1. Claim 7 is similar to claim 1 in that the screen indicia on the display device corresponding to a location of the problem on the schematic representation of the data acquisition system is also recited. As mentioned above, this is not taught or suggested in the *Schleiss* reference. Appellants therefore respectfully request the Board to reconsider the rejection of claim 7.

Claim 8

Claim 8 is directed to a CT system. No teaching or suggestion is provided in the *Schleiss* reference for a CT system. Appellants therefore respectfully request the Board to reverse the rejection of claim 8.

Claim 16

Claim 16 is directed to a method that contains similar limitations with respect to the architectural representation of the data acquisition system and the screen indicia. Therefore, claim 16 is also believed to be allowable for the same reasons set forth above with respect to claim 1. Therefore, because each and every element of the claims is not found in the *Schleiss* reference, applicants respectfully request the Board to reverse the Examiner's position.

Claim 17

Claim 17 recites that the data is received through an interface. The *Schleiss* reference does not teach or suggest the use of an interface in connection with the missing elements of the architectural representation described above with respect to claim 16. Therefore, Appellants respectfully request the Board to reverse the Examiner's position with respect to claim 17 independent of claim 16.

The Rejection of Claims 9-14 and 18-20 Over *Schleiss* in View of *Taguchi*

Claim 9

The Examiner admits on page 3 of the Final Office Action that, "Schleiss et al teach the system as stated above except that the data acquisition system is disposed within the computed tomography system." The Examiner cites the *Taguchi* reference for the CT system. The Examiner points to Col. 12, line 60 to Col. 13, line 7, Figure 1, and Col. 16, lines 41-67, and Col. 12, lines 13-40. This corresponds to a first embodiment recited in the *Taguchi* reference. As cited in the paragraph beginning on line 6 of Col. 12, the first embodiment is a picture

archiving communication system containing a medical information processing system according to this embodiment. Because this is a picture archiving system, claim 12 recites that various types of modalities of images or pictures may be stored therein. However, the present invention does not relate specifically to a computed tomography system. The system is an archiving communication system rather than an actual CT type system. Claim 9 specifically recites a data acquisition disposed within a CT system. Because a computed tomography system is illustrated, a data acquisition therein is also not set forth in either the *Taguchi* reference or the *Schleiss* reference. Appellants respectfully request the Board to reverse the Examiner's rejection with respect to this claim.

Claim 10

Claim 10 recites that the computed tomography system comprises a detector and a data acquisition system disposed within the detector assembly. Because no computed tomography system is taught or suggested in the *Taguchi* reference, this claim is also believed to be independently patentable. Appellants respectfully request the Board to reverse the Examiner's rejection with respect to this claim.

Claims 11 and 12

Claim 11 recites that the data is stored in a memory. Claim 12 recites that the data is communicated from the data acquisition system. These elements in combination with the recitations of claim 7 are not taught or suggested in either the *Taguchi* and *Schleiss* references. Appellants respectfully request the Board to reverse the Examiner's rejection with respect to these claims.

Claims 13 and 14

Claim 13 recites that the data acquisition system is located remotely from the diagnostic system. Claim 14 recites that a network couples the computer controller and the data acquisition system. Although the *Schleiss* reference is a diagnostic tool, the diagnostic system is not remotely located from the data acquisition system. Therefore, claims 13 and 14 are also believed to be allowable over *Schleiss* in view of *Taguchi*. Appellants respectfully request the Board to reverse the Examiner's rejection with respect to these claims.

Claim 18

Claim 18 depends upon claim 16 and recites that receiving the data comprises remotely receiving the data. Appellants can find no teaching or suggestion in either the *Schleiss* reference or the *Taguchi* reference for remotely receiving the data. Appellants respectfully request the Board to reverse the Examiner's rejection with respect to this claim.

Claim 19

Claim 19 recites that the data is communicated from the data acquisition system. No teaching or suggestion is provided in either reference for a data acquisition communicating the data.

Claim 20

Claim 20 depends upon claim 16 and recites that the data acquisition system is disposed within a CT system. As mentioned above, no teaching or suggestion is provided in either the *Schleiss* reference or the *Taguchi* reference for a CT system. The *Taguchi* reference is a medical information processing system and not a CT system. The *Schleiss* reference also does not teach or suggest a CT system as admitted by the Examiner as pointed to above. Appellants therefore respectfully request the Board to reconsider the rejection of claim 20 as well.

VII. Appendix

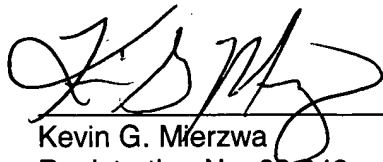

A copy of each of the claims involved in this appeal, namely claims 1-20 are attached hereto as Appendix A.

X. Conclusion

For the foregoing reasons, Appellants respectfully request that the Board direct the Examiner in charge of this examination to withdraw the rejections.

Please charge any fees required in the filing of this appeal to deposit account 50-0476.

Respectfully submitted,

Kevin G. Mierzwa
Registration No. 38,049
Attorney for Appellants

APPENDIX A

1. A diagnostic system for a data acquisition system comprising:
a computer controller coupled to the data acquisition system;
a display device coupled to the computer controller;
said controller receiving data from said data acquisition system, diagnosing a problem in response to said data, said controller generating a screen display corresponding to an architectural representation of the data acquisition system, said controller generating a screen indicia on said display device corresponding to a location of a problem on the schematic representation of the data acquisition system.
2. A diagnostic system as recited in claim 1 wherein said data is stored in a memory.
3. A diagnostic system as recited in claim 1 further comprising a network coupling said computer controller and said data acquisition system.
4. A diagnostic system as recited in claim 3 wherein said network comprises a public service telephone network.
5. A diagnostic system as recited in claim 3 wherein said network comprises the Internet.
6. A diagnostic system as recited in claim 1 wherein said controller has a web browser, said controller generating the screen indicia through said web browser.
7. A system comprising:
a diagnostic system;
a data acquisition system coupled to the diagnostic system;
a computer controller coupled to the data acquisition system;
a display device coupled to the computer controller;
said controller receiving data from said data acquisition system, diagnosing a problem in response to said data, said controller generating a screen display corresponding to an architectural representation of the data acquisition system, said controller generating a

screen indicia on said display device corresponding to a location of a problem on the schematic representation of the data acquisition system.

8. A computed tomography system comprising a system as recited in claim 7.

9. A system as recited in claim 7 further comprising a computed tomography system, the data acquisition system is disposed with the computed tomography system.

10. A system as recited in claim 9 wherein the computed tomography system comprises a detector assembly, said data acquisition system disposed within said detector assembly.

11. A system as recited in claim 7 wherein said data is stored in a memory.

12. A system as recited in claim 7 wherein said data is communicated from said data acquisition system.

13. A system as recited in claim 7 wherein said data acquisition system is located remotely from said diagnostic system.

14. A system as recited in claim 7 further comprising a network coupling said computer controller and said data acquisition system.

15. A system as recited in claim 7 wherein said controller has a web browser, said controller generating the screen indicia through said web browser.

16. A method for operating a diagnostic system comprising:
receiving data from a data acquisition system;
diagnosing a problem in response to said data;
generating a screen display corresponding to an schematic representation of the data acquisition system; and

generating a screen indicator on said display device corresponding to a location of a problem on the schematic representation of the data acquisition system.

17. A method as recited in claim 16 wherein receiving data comprises receiving data through an interface.

18. A method as recited in claim 16 wherein receiving data comprises remotely receiving data.

19. A diagnostic system as recited in claim 1 wherein said data is communicated from said data acquisition system.

20. A method as recited in claim 16 wherein said data acquisition system is disposed within a CT system.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

FEE TRANSMITTAL for FY 2005

Effective 10/01/2004. Patent fees are subject to annual revision.
